Date Order Numbers

Install and configuration guide. Replaces Magento's 000000123 order numbers with readable date-based numbers such as 20261112-001, restarting every day.

PACKAGE	MODULE	REQUIRES	LICENSE
blueprint3d/module-date-order-numbers	BluePrint3D_DateOrderNumbers	Magento 2.4.x | PHP 8.1-8.5	Proprietary EULA

1 What it does

Out of the box Magento numbers orders 000000001, 000000002 and so on. They say nothing about when an order was placed, and every order number looks the same as every other document number. This module replaces them with numbers built from the date.

With the default settings the first order on 12 November 2026 is **20261112-001**, the second is **20261112-002**, and the count starts again at 001 the next morning. A prefix is optional, so a store can use **FW-20261112-001**. Invoices, shipments and credit memos can share the order number, so customers and staff see one number for everything to do with an order.

NOTE Only new orders and documents are affected. Existing order numbers never change, and the module ships switched off, so nothing happens until you enable it.

2 Installation

1 Install via Composer

```
$ composer require blueprint3d/module-date-order-numbers
```

2 Enable the module

```
$ php bin/magento module:enable BluePrint3D_DateOrderNumbers
```

3 Run setup upgrade

```
$ php bin/magento setup:upgrade
```

4 Compile and flush cache

```
$ php bin/magento setup:di:compile
$ php bin/magento cache:flush
```

3 Configuration

Settings are per store view, so one store can use date-based numbers while another keeps Magento's defaults. Find them in:

`Stores > Configuration > **BluePrint3D** > Date Order Numbers`

FIELD	CONTROLS	DEFAULT
Enable Date-Based Numbers	Switches the module on for the selected scope.	No
Number Style	Sequential (001, 002, 003 ...) or Random (a different random number each time, never repeated in a day).	Sequential
Date Format	PHP date format, in the store's timezone. Ymd gives 20261112.	Ymd
Separator	Text between the date and the number.	-
Sequential Number Length	Digits the daily count is padded to. 3 gives 001. Past the limit the number simply gets longer.	3
Random Number Length	Digits in the random part (Random style only). Grows automatically if a very busy day fills it.	4
Share the Order Number	Invoices, shipments and credit memos reuse the order's number. A second partial invoice or shipment gets -2, -3 and so on.	Yes
Prefixes	Optional text at the start of order, invoice, shipment and credit memo numbers, such as FW-, INV-, SH- and CM-.	Empty

4 What your numbers look like

SETUP	ORDER	INVOICE	SHIPMENT
Defaults, shared numbers	20261112-001	20261112-001	20261112-001
Prefixes FW- / INV- / SH-	FW-20261112-001	INV-20261112-001	SH-20261112-001
Random style	20261112-4827	20261112-4827	20261112-4827
Second partial invoice	20261112-001	20261112-001-2	-

SAFE UNDER LOAD Numbers are issued with a single atomic database statement, so two customers checking out at the same moment can never receive the same number. Random numbers are claimed the same way and never repeat within a day.

5 Good to know

- **Midnight.** The day changes at midnight in the store's timezone. A basket started before midnight and paid after it is numbered with the day it was actually placed.
- **Existing orders.** Orders placed before you enabled the module keep their numbers. Their later invoices and shipments keep Magento's normal numbering.
- **Length.** Magento limits order numbers to 32 characters. Prefix, date, separator and number together must fit.
- **Turning it off.** Set Enable Date-Based Numbers to No. New orders return to Magento's numbering straight away; nothing else needs undoing.
- **Integrations.** Payment, shipping, analytics and marketplace tools that read the order number receive the new value automatically. Systems that expect digits only should be checked before you switch on.
